                                                                               /clone lib="Human Retinal pigment epithelium/choroid cINA (Un-normalized, unamplified): cg"
/note="Organ: Eye; Vector: pcMVSPORT6; Two different dcnor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 34C ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pcMVSPORT6 vector was constructed at Life Technologies (Rockville, MD; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp. chttp://www.invitrogen.com/>). The library code designation was cs. For this library, cDNA inserts were cloned into the NotI/Mull sites of the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the clog-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from
                                                                                                                                                                                                                                                                                                                  08-JUL-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' - and 3' -ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention. Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO

Antibodies and other binding proteins, are used as immunoassay reagents to detect zsig46 or cells expressing it, e.g. for assessing thyroid function to produce anti-idiotypic antibodies, for affinity purification of zsig46, to screen expression libraries, to neutralise zsig46 activity, and to deliver toxins, radioisotopes etc. for therapeutic or diagnostic purposes. Agonists of the product can be used to promote growth, differentiation and proliferation of specific cell types, e.g. for treating (extra)thyroid diseases or as additive to cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAZ24802) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 95 novel genes and their fragments (nucleic acid sequences: AAZ24811-Z24907; amino acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypuscleotides. Specific uses are described for each of the 95 polynucleotides, based on which tissues they are most highly expressed in (see AAZ24811 for described uses)

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of till length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   08-JUL-1999;

The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CD NA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one member, CC degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of CC classes, the degree of methylation is calculated. The method is used: CC oligomers, the degree of methylation is calculated. The method is used: CC and of a wide range of diseases, e.g. cancer, disorders of the central CC nervous, cardiovascular, gastrointestinal and respiratory systems etc., CC particularly by detecting mutations or single nucleotide polymorphisms CC (SNP's); and (ii) for differentiation. The method allows the methylation CC investigating cell differentiation. The method allows the methylation CC amposits of the degree of cytosine methylation described in the discrement of the degree of cytosine methylation described in the method classes of the convertion.

```

```
This invention describes a novel method for determining the degree of C methylation of a particular cytosine in a motif 5'-CpG-3', present in a C genomic sample of DNA. The sample is treated chemically to convert C cytosine (C) but not methylated C, to uracil, then part of the genomic C DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, C of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the C degree of hybridisation to both classes is determined from the label on C the amplicon. From the ratio of labels hybridised to the two classes of coligoners, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central C nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation c status of many C residues to be determined simultaneously. ABQ13410-C ABQ54121 regreenty genomic DNA sequences used to illustrate the method constitution of disclosure of the invention

This invention describes a novel method for determining the degree of cc methylation of a particular cytosine in a motif 5'.CpG-3', present in a cc genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic CDNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one member, co degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of CC oligomers, the degree of methylation is calculated. The method is used: CC in for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central conservous, cardiovascular, gastrointestinal and respiratory systems etc., CC particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation convestigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method conference of the invention o

                                                                                                                                                                                                                                                                                                    This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of coligoners, the degree of methylation is calculated. The method is used: (a) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation of cell or tissue types and for status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for disclosure of the invention
                                                                                                 Percent Similarity:
                                                                 Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-SEP-2000; 2000DE-01043826.

                                                                                                                                                            cc rhis invention describes the isolation of a novel human secreted protein, cz zsig46 encoded by a gene on chromosome 13 which is mainly expressed in ct the thyroid. This product can be used to study secretion of proteins from cc cells and also to treat or prevent deficient expression of zsig46, which cc may be associated with thyroid diseases (e.g. hypothyroidism, Graves' cd disease, thyrotoxicosis, thyroid cancer etc.) or with diseases that involve genes in the same region of chromosome 13 (e.g. Hirschaprung's cc disease, neuronal ceroid-lipofucinosis, Wilson disease and Reiger syndrome). Antibodies and other binding proteins, are used as immunoassay creagents to detect zsig46 or cells expressing it, e.g. for assessing thyroid function to produce anti-idiotypic antibodies, for affinity purification of zsig46, to screen expression libraries, to neutralise zsig46 activity, and to deliver toxins, radioisotopes etc. for therapeutic or diagnostic purposes. Agoniets of the product can be used to promote growth, differentiation and proliferation of specific cell types, e.g. for treating (extra)thyroid diseases or as additive to cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5

```

lactation or muscle and

The invention relates to a purified nucleic acid molecule

deposition

(designated

LMFD),

derived associated with Claim 2; SEQ ID NO 12900; 245pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    JS-10-010-050A-2_COPY_1_30 (1-30) x ABX47735 (1-256)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 1512 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are [1] a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and [2] determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the

The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a DNA sequence encoding a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New plant genes encoding polypeptides having an activity involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain useful in generating plants having improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zhu T, Cheng W, Briggs S, Glazebrook J, Katagiri F,

Clactation or muscle and fat deposition (designated LMPD), derived from C cattle, and the LMFD nucleic acid can specifically hybridise to a second C nucleic acid molecule comprising any of 15112 nucleotide sequences, C appearing as ABX34836-ABX49947, or complements of them. Also included are (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non-translated sequence that C functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and C (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is predictive of the complementary nucleic acid is nad nalysis, cattle breeding, preparation of constructs for use in cattle gene expression, cr for genetically improving cattle. The present sequence is one of the present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:

New nucleic acid associated with lactation, and muscle and deposition, useful for genome mapping, gene identification cattle breeding, or for genetically improving cattle. analysis

WPI; 2003-110599/10

Claim 2; SEQ ID NO 11275; 245pp; English.

Clactation or muscle and fat deposition (designated implementary muscle and fat deposition (designated impl), derived from cattle, and the IMFD nucleic acid can specifically hybridise to a second coursels acid molecule comprising any of 15112 nucleotide sequences, complements of them. Also included are coid linked to a promoter and a 3′ non-translated sequence that coid linked to a promoter and a 3′ non-translated sequence that coid polyadenylated ribonucleotides to a 3′ end of the mRNA molecule; and complementary nucleic acid sequences or its complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule or its sue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or the detection of the complementary nucleic acid molecule obtained from the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where complementary nucleic acid molecule. The IMFD nucleic acid is used for the detection of the molecule. The IMFD nucleic acid is used for cording, preparation of the molecule. The IMFD nucleic acid is used for the setting, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the present sequence was not shown in the sequence tag) nucleic acids. Note: The corsents sequence was not shown in the sequence tag) nucleic acid and in a cordinal process of the corporation of the molecule in a bovine cell or tissue. The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from seqdata.uspto.gov/sequence.html?DocID=20020137139 electronic present sequence was not shown in the specification format from the USPTO web site:

/notes—Tvector: PCNS; Site 1: EcoRI; Site 2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oilgo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors
                                               strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Top10F' by electroporation method. The cDNA libraries
constructed by this method are full-length enriched cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          poly
